Hewlett-Packard Reaping Benefits of Dynasound's CAAD Software Program

With the help of Dynasound, Inc.'s innovative, Window's® -based CAAD (Computer- Aided Acoustical Design) software program, Hewlett-Packard's Atlanta location is reaping the benefits of their new Dynasound masking system. The Hewlett-Packard installation also represents Dynasound's largest sound masking project incorporating an enhanced analog signal, programmable time-varying level controller, and precision computer equalization.

The site, an amazing 620,000 sq. ft., had original plans to install 65" high furniture panels throughout the open office areas — *without the addition of sound masking*. Using CAAD, a Dynasound representative input the original data and then reconfigured the system using 48" furniture panels and a complete sound masking system. At one-

tenth the cost of increasing panel heights, Dynasound Inc.'s CAAD software was able to determine that 48" furniture panels plus the addition of sound masking would significantly increase employee productivity and accuracy over the original 65" furniture panels and no masking.

Speech privacy success with sound masking at other Hewlett-Packard sites prompted the masking installation in Atlanta. The sound masking installation included approximately 300,000 sq. ft of open office space.

The 20-story building offers Hewlett-Packard employees numerous amenities including a retail level complete with stores, a data center, a large plaza lobby, a customer conference center & demo area for Hewlett-Packard's products, and a cafeteria with indoor and outdoor seating for 600.
